

*Mendocino County Russian River Flood Control
& Water Conservation Improvement District*

STAFF REPORT

**Agenda Item 6: Water Supply Conditions
Monday, November 6, 2023**

The Strategic Plan relevant priorities are: **Security** through ensuring reliable, resilient, and available sources of water; **Advocacy** in support of equitable water resource stewardship; and **Use** of water in effective and beneficial ways as a public resource, all in alignment with the District’s Mission to steward water resources for the benefit of people and the environment.

Operations of the Trans-Basin Diversion Through PG&E Owned “Potter Valley Project”

As reported last month, on October 2, 2023, FERC issued an order approving PG&E’s Temporary Variance of Flow Requirements that will be in effect until Lake Pillsbury storage exceeds 36,000 acre-feet following October 1, 2023, or when the variance is superseded by another variance. PG&E states that the 36,000 acre-feet storage threshold would allow it to meet minimum flow obligations through January 2024 in the event of extremely low inflow in early winter.

PG&E held the first Drought Working Group to review various reports on water supply and temperature. It was noted that the next flow variance is being developed and scheduled to be submitted to FER very early 2024.

Lake Mendocino and the Mainstem Upper Russian River

Lake Mendocino storage level was 68,674 acre feet (af) on October 30, 2023, down from 76,756 af on October 2, 2023. The mainstem Russian River continues to operate under a Temporary Urgency Change Order. www.sonomawater.org/tucp.
